Good question Since you already **created Codespace from your GitHub repo**, pushing changes is actually very simple.

✅ 1. Check if your Codespace is connected to repo

In Codespace terminal run:

git remote -v

You should see something like:

origin https://github.com/username/repo-name.git

If yes → already connected ✔

✅ 2. Push project to GitHub (First time)

After creating or editing files:

Step 1 → Check changed files

git status

Step 2 → Add files

Add all files:

git add .

OR add specific file:

git add file_name.py

Step 3 → Commit

git commit -m "Initial project upload"

Step 4 → Push

git push origin main

(or master if your branch name is master)

That's it 🎉 Your repo is updated.

✅ 3. When you change files later

Just repeat:

```
git add .
git commit -m "Updated code"
git push
```

You don’t need to write origin main every time.

✅ 4. Update only SOME parts of repo

If you changed only few files:

```
git add file1.py file2.py
git commit -m "Updated only preprocessing"
git push
```

Only those files updated.

✅ 5. Undo before push (if mistake)

Unstage file:

```
git restore --staged file.py
```

Undo changes:

```
git checkout -- file.py
```
